

SOLUTION REQUIREMENTS

Date	29-09-2026
Team ID	SWTID-2026-1971
Project Title	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. Automated Laptop Request Processing

The system should automate the processing of standard laptop requests after the service request is approved. This reduces manual intervention and helps avoid delays in the procurement process.

2. Automatic Task Creation

Once a standard laptop request receives approval, the system should automatically create a Catalog Task for laptop configuration. The task should contain the required description and request information.

3. Automatic Assignment to Hardware Team

The generated configuration task should automatically be assigned to the Hardware assignment group so that the responsible team can configure the laptop without requiring manual assignment.

4. Approval-Based Workflow

The workflow should verify that the request is Approved before creating the configuration task. This ensures that configuration activities are initiated only for approved requests.

5. Service Catalog Integration

The solution should integrate the automated flow with the Standard Laptop Service Catalog item. The flow should be associated with the Standard Laptop catalog item so that requests use the automated workflow.

6. Status Tracking

Users and the IT team should be able to track the request status through the Service Catalog and Requested Item records. The generated Catalog Task should display its updated status, short description, and assigned group.

7. Reduce Manual Work

The solution should minimise manual intervention in the procurement and configuration process by automatically generating and assigning tasks.

8. Reduce Errors and Delays

The automated workflow should reduce the possibility of configuration tasks being overlooked or delayed and help minimise errors associated with manual processing.

9. Improve Resource Utilisation

The solution should improve IT resource utilisation by automatically directing configuration tasks to the appropriate Hardware team.

10. Improve User Experience

The solution should provide a smoother procurement experience by ensuring that standard laptops are configured promptly, thereby reducing user waiting time.

Summary of Solution Requirements

- Automate standard laptop request processing.
- Automatically create configuration Catalog Tasks after approval.
- Automatically assign tasks to the Hardware team.
- Implement approval-based task creation.
- Integrate the workflow with the Standard Laptop Service Catalog.
- Provide request and task status tracking.

- Reduce manual intervention and processing errors.
- Minimise delays in laptop configuration.
- Improve IT resource utilisation.
- Provide a faster and more efficient user experience.
